

Association Between ALIKA Deployment and KULA Live-Chat Volume, CSAT, and Dislike Outcomes

Comparative observational study: June 2026 versus August 2026

Prepared: 31 August 2026

Abstract

Background: ALIKA was fully operational by August 2026. This study compares KULA activity and satisfaction with June 2026, before launch. Methods: Exports were deduplicated by conversation ID and restricted to currentAccount = 3-1-robot2. Welch's t-test compared mean ratings; chi-square tests compared CSAT (scores 4–5) and dislike (score 1) among rated conversations. Results: Unique connected users increased from 62,928 to 131,831 (+109.5%). CSAT changed from 56.88% to 57.87% ($p=0.642$); dislike changed from 35.89% to 35.22% ($p=0.742$). Conclusion: KULA volume was substantially higher after ALIKA launch, but quality differences were small and statistically nonsignificant. Observational comparison does not establish causality.

Keywords: ALIKA, KULA, chatbot, live chat, connected users, CSAT, dislike

1. Introduction

KULA is a live-chat chatbot identified by currentAccount = 3-1-robot2. June represents pre-ALIKA operation; August represents full ALIKA operation. ALIKA-origin routes are marked in changeFlag as 从 Alika 跳转 or 从 Alika 中途跳转. Study questions assess changes in connected-user volume, conversation activity, CSAT, and dislike outcomes.

2. Methods

2.1 Design and population

Retrospective observational before-after study covering 30 June days and 31 August days. Both monthly totals and daily-normalized outcomes were calculated.

2.2 Preparation and definitions

Exports were concatenated and deduplicated by id. June had 0 duplicate IDs and August had 95,917, mainly from overlapping exports. Missing scores were classified as unrated. Connected users were distinct userId values; CSAT was score 4–5; dislike was score 1.

2.3 Statistical methods

Welch's independent-samples t-test compared mean score. Pearson chi-square tests compared CSAT and dislike proportions. Significance threshold was $\alpha = 0.05$. These tests estimate association, not causal impact.

3. Results

3.1 Connected-user and conversation volume

Unique users increased by 68,903 (+109.5%), from 62,928 to 131,831. Conversations increased from 85,655 to 179,559 (+109.6%). Average daily users increased from 2,496 to 5,064 (+102.9%). Conversations per user stayed nearly constant (1.361 versus 1.362), suggesting growth came from more users, not more repeat conversations per user.

Table 1. Summary metrics.

Metric	June (before ALIKA)	August (after ALIKA)	Absolute change	Relative change (%)
Unique connected users	62,928.000	131,831.000	68,903.000	109.495
KULA conversations	85,655.000	179,559.000	93,904.000	109.630
Average unique users/day	2,495.567	5,063.806	2,568.240	102.912
Average conversations/day	2,855.167	5,792.226	2,937.059	102.868
Conversations per user	1.361	1.362	0.001	0.065
Rated conversations	872.000	1,417.000	545.000	62.500
Rating response rate (%)	1.018	0.789	-0.229	-22.483
Mean score	3.334	3.367	0.033	0.998
CSAT 4-5 (% rated)	56.881	57.869	0.988	1.737
Dislike score 1 (% rated)	35.894	35.215	-0.679	-1.892
Dislikes per 1,000 conversations	3.654	2.779	-0.875	-23.950

Figure 1. KULA Connected-User Volume

3.2 Satisfaction outcomes

Mean score changed from 3.334 to 3.367. CSAT increased 0.99 percentage points; dislike decreased 0.68 percentage points. No test was statistically significant.

Table 2. Statistical comparisons among rated conversations.

Metric	June	August	Difference	p-value
Mean score	3.334	3.367	0.033	0.679
CSAT 4-5 rate	56.881	57.869	0.988	0.642
Dislike score-1 rate	35.894	35.215	-0.679	0.742

Figure 2. KULA Satisfaction Outcomes

3.3 Route and transfer fields

August contained 779 explicitly ALIKA-marked KULA conversations (0.43%), but only 2 were rated. Direct ALIKA-route CSAT is therefore unstable. autoTransferType was populated in 0 KULA rows, preventing transfer-type outcome analysis.

4. Discussion

Main result is an approximately twofold increase in KULA connected-user and conversation volume during full ALIKA operation. Stable conversations per user indicate a number-of-users effect. Rated-user CSAT, dislike, and mean score remained statistically indistinguishable. Rating response declined from 1.02% to 0.79%, so satisfaction results apply only to respondents and may contain nonresponse bias.

5. Limitations

- Before-after design cannot separate ALIKA from seasonality, campaigns, product changes, staffing, or traffic-mix changes.
- Only two nonadjacent months were available; no control channel or interrupted time series was used.
- Approximately 1% of conversations were rated.
- Only two rated conversations carried explicit ALIKA-origin markers.
- autoTransferType was absent from KULA-scoped rows.
- Monthly user counts were not matched longitudinally across periods.

6. Conclusion

August KULA connected users and daily volume were approximately twice June levels. No statistically detectable CSAT, dislike, or mean-score change was found among rated conversations. Evidence supports a volume difference without measurable quality change, but does not prove ALIKA caused that difference.

7. Recommendations

1. Preserve ALIKA route and auto-transfer fields end-to-end by conversation ID.
2. Standardize rating prompts and improve response coverage.
3. Extend analysis to multiple pre/post months.

4. Use interrupted time-series or difference-in-differences with a comparable control account.
5. Report respondent dislike rate together with dislikes per 1,000 conversations.

Appendix. Reproducibility

Source analysis: notebooks/alika_effect_on_kula.ipynb. Report tables and figures were generated from deduplicated source exports in dataset_wellbore. Values may change if source exports are corrected or replaced.
